IN THE CLAIMS:

Claim 1 (currently amended): A fluid control apparatus comprising a plurality of lines (A), (B) arranged in parallel on a base member (1) and having inlets, as well as outlets, facing toward the same direction, each of the lines (A), (B) comprising a plurality of fluid control devices (2), (3), (4), (5), (6), (7), (17), (18), (19) arranged in an upper stage and a plurality of block coupling members (8) arranged in a lower stage, the fluid control apparatus being characterized in that at least one of the lines (A), (B) is provided on each of opposite sides thereof with a tape heater (11), a space for positioning a tape heater holding clip (13) therein being provided in each of locations between adjacent fluid control devices (2), (3), (4), (5), (6), (7), (17), (18), (19), the tape heaters (11) being held from opposite sides thereof to the line (A, B) by the clip (13), the line (A, B) provided with the heaters being mounted on a line support member (10) removably attached to the base member (1).

Claim 2 (currently amended): A fluid control apparatus comprising a plurality of lines (A), (B) arranged in parallel on a base member (1) and having inlets, as well as outlets, facing toward the same direction, each of the lines (A), (B) comprising a plurality of fluid control devices (2), (3), (4), (5), (6), (7), (17), (18), (19) arranged in an upper stage and a plurality of block coupling members (8) arranged in a lower stage, the fluid control apparatus being characterized in that each of the lines (A), (B) is mounted on a line support member (10) removably attached to the base member (1), the line support member (10) having a heater insertion bore (14) formed therein and extending

longitudinally thereof, a sheath heater (12) being inserted into the bore (14), wherein each

of the coupling members is slidably mounted on the line support member, and each of the

fluid control devices is mounted on at least two adjacent coupling members.

Claim 3 (currently amended): A fluid control apparatus according to claim 1 wherein

the line support member (10) has a heater insertion bore (14) formed therein and

extending longitudinally thereof, and a sheath heater (12) is inserted into the bore (14).

Claim 4 (currently amended): A fluid control apparatus according to claims 1 to

claim 1 or claim 3 wherein each of the coupling members (8) is slidably mounted on the

line support member (10), and each of the fluid control devices (2), (3), (4), (5), (6), (7),

(17), (18), (19) is mounted on at least two adjacent coupling members (8).

Claim 5 (currently amended): A fluid control apparatus according to any one of

claims 1 to 3 which is characterized in that the base member (1) has a plurality of lateral

rails (1a) made of a nonmetallic material and extending in a direction orthogonal to the

lines (A), (B), the line support member (10) of each of the lines (A), (B) being mounted on

the base member (1) slidably in a lateral direction.

Claim 6 (currently amended): A fluid control apparatus according to claim 1 wherein

3

Serial Number: 10/511,431 OA dated October 10, 2006

Amdt. dated January 10, 2007

the tape heater (11) is held in contact with bodies (17a), (18a), (19a) of the fluid control

devices (17), (18), (19) and with the block coupling members (8).

Claim 7 (new): A fluid control apparatus comprising a plurality of lines arranged in

parallel on a base member and having inlets, as well as outlets, facing toward the same

direction, each of the lines comprising a plurality of fluid control devices arranged in an

upper stage and a plurality of block coupling members arranged in a lower stage, the fluid

control apparatus being characterized in that each of the lines is mounted on a line support

member removably attached to the base member, the line support member having a

heater insertion bore formed therein and extending longitudinally thereof, a sheath heater

being inserted into the bore, wherein the base member has a plurality of lateral rails made

of a nonmetallic material and extending in a direction orthogonal to the lines, the line

support member of each of the lines being mounted on the base member slidably in a

lateral direction
